

CEV MarineCharge – Smart EV Charging Management System for Boats, Marinas, and Electric Vessels

Sector: Marine infrastructures

Short description of the needs:

CEV Technologies is expanding its proven EV charging management platform into the marine sector to support the growing electrification of boats and vessels. Current marina charging infrastructure is fragmented, complex to use, and often lacks fiscal compliance and seamless payment systems.

The company aims to develop and deploy a standardized, user-friendly marine charging solution that enables simple “tap, charge, and go” functionality, similar to land-based EV charging. To achieve this, CEV Technologies seeks collaboration with marina operators, hardware manufacturers, and technology partners to pilot marine-grade charging infrastructure, integrate real-time billing and fiscalization, and ensure interoperability with vessel and marina systems. The solution will support sustainable maritime mobility and efficient energy management across the Adriatic region.
