

Investment in Specialized Technical Profiles for Advanced Marine Monitoring Services

Sector: Marine monitoring & surveillance

Short description of the needs:

ELICA S.r.l. is a technology integrator and service provider in marine environmental monitoring, offering oceanographic sensors, sonar and acoustic systems, ROVs, and marine drones. Combining technological expertise with offshore operational experience, the company supports research, sustainable fisheries, aquaculture, and offshore activities.

The challenge is to strengthen ELICA's internal capabilities by investing in specialized technical profiles skilled in marine technologies, data analysis, and field operations. This will reduce reliance on project-based funding and enable scalable, continuous, data-driven services, such as monitoring-as-a-service.

The focus is on developing hybrid skills in system integration, marine data management, AI-supported analysis, offshore operations, and stakeholder coordination. Benefits include improved service continuity, better data utilization, and enhanced competitiveness in the blue economy.

ELICA seeks collaboration with universities, research centers, and technology partners to co-develop training programs, pilot services, and innovative monitoring solutions.
